

SCENARIO 05

Scenario Name	API Testing
Weak Prompt	Write API test cases for user registration.
What I Feel is Missing	The weak prompt doesn't follow the ICEPOT framework. It doesn't provide key prompt inputs like Context, Example, Persona, Output, and Tone. It just gives a vague instruction without any specific instruction keywords like [MANDATORY], [CRITICAL], [HIGH PRIORITY], etc.
Instruction	[MANDATORY] Create test cases for a RESTful user registration API. [MANDATORY] The user registration takes in the user's Full Name, email ID, address, phone number, and user-created password. [MANDATORY] Generate 15 test cases covering all possible scenarios [MANDATORY] Create both positive and negative test cases covering all edge cases [CRITICAL] The test cases should be formatted as a table containing Test Case ID, Test Scenario, Input Parameters, Expected Output, Positive/Negative Scenario Flag, and Data Requirement
Context	Act as a Senior QA Engineer with 8+ years of experience and generate test cases for a RestFul user registration API
Example	The test cases need to follow the format below. Test Case ID, Test Scenario, Input Parameters, Expected Output, Positive/Negative Scenario Flag, and Data Requirement
Persona	Once the Test Cases are created, act as a QA Test Lead with 12+ years of experience to review the test cases and refine them according to industry best practices, so that the test cases can be directly utilized to test live projects
Output Format	The test cases need to be generated in Excel format, with each sheet containing an individual test case. The sheet should be named as per the test case ID, and the sheet header should contain the scenario name that the test case is validating
Tone	Be concise, direct, and professional. The test cases need to be brief and crisp, but shouldn't miss any scenario.

Rewritten Prompt	Context - Act as a Senior QA Engineer with 8+ years of experience and generate test cases for a RESTful user registration API. Instructions - While generating the test cases, please follow the instructions below [MANDATORY] Create test cases for a RESTful user registration API. [MANDATORY] The user registration takes in the user's Full Name, email ID, address, phone number, and user-created password. [MANDATORY] Generate 15 test cases covering all possible scenarios [MANDATORY] Create both positive and negative test cases covering all edge cases [CRITICAL] The test cases should be formatted as a table containing Test Case ID, Test Scenario, Input Parameters, Expected Output, Positive/Negative Scenario Flag, and Data Requirement Example - The test cases need to follow the format below. - Test Case ID Test Scenario Input Parameters Expected Output Positive/Negative Scenario Flag Data Requirement Persona - Once the Test Cases are created, act as a QA Test Lead with 12+ years of experience to review the test cases and refine them according to industry best practices, so that the test cases can be directly utilized to test live projects. Output - The test cases need to be generated in Excel format, with each sheet containing an individual test case. The sheet should be named according to the test case ID, and the sheet header should include the scenario name that the test case validates. Tone - Be concise, direct, and professional. The test cases need to be brief and crisp, but shouldn't miss any scenario.
Observations	1. With the weak prompt, AI had no context of what kind of test cases it needed to generate. Hence, it created test cases for all types of testing, including functional, database, security, and performance testing. With the refined prompt, the scope of AI was defined, and hence it generated tests specific to functional testing covering positive, negative, and edge case scenarios 2. As the input parameters were not specified in the weaker prompt, AI assumed a generic JSON request body. In the refined prompt, the request parameters during user registration were explicitly specified, and hence the AI could generate test cases based on the expected user registration input parameters 3. Without an output format specified in the weaker prompt, the test cases were generated in the AI chat window as text without following any structured format. In the refined prompt, as the output format was explicitly specified as an Excel spreadsheet with each sheet containing an individual test case in the specified tabular format, it created a concise and structured Excel output that can be directly shared with project stakeholders

SCENARIO 01

Scenario Name	Search Functionality
Weak Prompt	Test the search feature.
What I Feel is Missing	The prompt doesn't provide any background or context on what needs to be tested. It doesn't give any information about the search functionality. The platform type is missing where the search functionality is deployed, and doesn't specify any failover mechanism in case the search results are not found
Instruction	[MANDATORY] Test the product search functionality of an e-commerce platform. [MANDATORY] The platform URL is https://www.amazon.com. [MANDATORY] Testing should cover all possible functional validations for product search. [MANDATORY] Create a detailed result of each scenario that was tested, along with the encountered output for each scenario. [CRITICAL] Cover both positive and negative scenarios, along with all edge cases possible. [MANDATORY] Once the test is completed, also generate a test case document containing the scenarios that were tested. [MANDATORY] The test cases need to follow the format below. Test Case ID Test Scenario Input Parameters Expected Output Positive/Negative Scenario Flag Data Requirement
Context	Act as a Senior QA Engineer with 8+ years of experience, to test the product search functionality of Amazon
Example	Look up on the internet and research the most critical tests that are performed for the product search functionality of e-commerce applications, and what are the best practices and industry standards followed. Based on the findings from the research perform the test
Persona	Once testing is complete, act as a QA Test Lead with 12+ years of experience to review the test and refine it in line with industry best practices, ensuring it covers all possible scenarios. Add any new scenarios for testing if you feel anything was missed during the previous round
Output Format	Create 2 Excel files. One containing the test results and another containing the test cases that were tested. The test results should include the test case ID, scenario name, expected outcome, obtained outcome, and test status (passed or failed) based on the obtained outcome. The test case document should contain a separate sheet for each test case. The sheets should be named according to the test case ID, and the sheet header should include the scenario name that the test case validates.
Tone	Be concise, direct, and professional. The test cases need to be brief and crisp, but shouldn't miss any scenario.

Rewritten Prompt	Context -Act as a Senior QA Engineer with 8+ years of experience, to test the product search functionality of Amazon. Example -Look up on the internet and research the most critical tests that are performed for the product search functionality of e-commerce applications, and what are the best practices and industry standards followed. Based on the findings from the research, perform the test Instructions - While generating the tests, please follow the instructions below [MANDATORY] Test the product search functionality of an e-commerce platform. [MANDATORY] The platform URL is https://www.amazon.com. [MANDATORY] Testing should cover all possible functional validations for product search. [MANDATORY] Create a detailed result of each scenario that was tested, along with the encountered output for each scenario. [CRITICAL] Cover both positive and negative scenarios, along with all edge cases possible. [MANDATORY] Once the test is completed, also generate a test case document containing the scenarios that were tested. [MANDATORY] The test cases need to follow the format below. Test Case ID Test Scenario Input Parameters Expected Output Positive/Negative Scenario Flag Data Requirement Persona - Once testing is complete, act as a QA Test Lead with 12+ years of experience to review the test and refine it in line with industry best practices, ensuring it covers all possible scenarios. Add any new scenarios for testing if you feel anything was missed during the previous round. Output - Create 2 Excel files. One containing the test results and another containing the test cases that were tested. The test results should include the test case ID, scenario name, expected outcome, obtained outcome, and test status (passed or failed) based on the obtained outcome. The test case document should contain a separate sheet for each test case. The sheets should be named according to the test case ID, and the sheet header should include the scenario name that the test case validates. Tone - Be concise, direct, and professional. The test cases need to be brief and crisp, but shouldn't miss any scenario.
Observations	1. With the weak prompt, AI had no information available regarding the platform where it needed to perform the testing 2. Also, no context was provided, no example of what to execute, and no persona details to review the generated results. With all this information missing, the AI generated a very vague response that did not reflect the expected output. 3. With the weak prompt, the AI did not generate any test results; instead, it only produced a message stating the test was successful. It provided no information on what scenarios were tested, test case IDs, test passes or failures, etc.

SCENARIO 07

Scenario Name	Dashboard / Report Generation
Weak Prompt	Test the reports section.
What I Feel is Missing	The prompt doesn't contain any reference of what type of report needs to be tested; Automation test report/performance reports/medical reports/financial report etc. It doesn't contain file format of the report. Whether the report is an HTML file/excel file/word doc etc. Hence for the sake of this test we have generated a dummy HTML file that contains performance test report of an application. With the help of the prompt we are going to test the performance test report
Instruction	[MANDATORY] Go through the report and summarise the observations of the test based on the information available. [MANDATORY] Once the information is collected, refine the observations to make them executive-friendly. The observations will be used to create the executive test summary report [MANDATORY] In case you are not clear and have follow-up queries, ask those questions one by one to gather your knowledge [MANDATORY] Do not ask more than 10 questions
Context	Act as a Performance Test Architect and analyze the test performance report attached with the prompt
Example	
Persona	Once the creation is complete, apply your Performance Test Architect skill to refine the observations and develop measurable/verifiable points to share with project stakeholders. Make sure that the output is executive-friendly
Output Format	Generate the final observations in the form of a 2-page Word document
Tone	Be concise, direct, and professional. The test cases need to be brief and crisp, but shouldn't miss any scenario.
Rewritten Prompt	Context -Act as a Performance Test Architect and analyze the test performance report attached with the prompt Example Instructions [MANDATORY] Go through the report and summarise the observations of the test based on the information available. [MANDATORY] Once the information is collected, refine the observations to make them executive-friendly. The observations will be used to create the executive test summary report [MANDATORY] In case you are not clear and have follow-up queries, ask those questions one by one to gather your knowledge [MANDATORY] Do not ask more than 10 questions Persona - Once the creation is complete, apply your Performance Test Architect skill to refine the observations and develop measurable/verifiable points to share with project stakeholders. Make sure that the output is executive-friendly Output - Generate the final observations in the form of a 2-page Word document Tone - Be concise, direct, and professional. The test cases need to be brief and crisp, but shouldn't miss any scenario.

Observations	1. With the weak prompt, AI had no information available regarding the type of report it needs to test. Hence it generated a generic response regarding how a report testing needs to be performed instead of providing a direct relevant response. 2. The weak prompt had context missing resulting in the AI assuming a context based on our previous conversations and not something specific for this particular scenario. 3. With the weak prompt, the AI did not generate any conclusive response.
